Abstract (quoted verbatim from the publication)

We analyze how social insects coordinate complex foraging behaviors without centralized control. Through stigmergy, individual workers deposit pheromone cues in the environment, creating positive feedback loops that guide nestmates to high-reward food sources while evaporation allows dynamic rerouting.

Reading prompts

1. What is the core problem addressed and what assumptions are made?
2. What mathematical or structural abstractions represent the physical phenomena?
3. How can this concept be mapped or transferred to analogous problems in other domains?

This card is a workshop wrapper prepared by the organisers. Only the abstract is quoted from the publication; read the paper itself through the link above before asserting any relationship.
