Domain DOM_NET

Abstract (quoted verbatim from the publication)

We review theoretical consensus algorithms for multi-agent network agreements. Using algebraic graph theory, we prove that asymptotic agreement across all network nodes is governed by the second smallest eigenvalue (Fiedler value) of the graph Laplacian.

Abstract quoted from R. Olfati-Saber et al., Proceedings of the IEEE (2007).

Notes: record the page or section for every claim you make about this paper.

Reading prompts

1. What is the core problem addressed and what assumptions are made?
2. What mathematical or structural abstractions represent the physical phenomena?
3. How can this concept be mapped or transferred to analogous problems in other domains?

This card is a workshop wrapper prepared by the organisers. Only the abstract is quoted from the publication; read the paper itself through the link above before asserting any relationship.
