Abstract (quoted verbatim from the publication)

MUMmer uses suffix trees to identify maximal unique matches between complete bacterial genomes. These anchor points form backbone alignments across extensive chromosomal rearrangements in linear runtime.

Abstract quoted from A. L. Delcher et al., Nucleic Acids Research (1999).

Notes: record the page or section for every claim you make about this paper.

Reading prompts

1. What is the core problem addressed and what assumptions are made?
2. What mathematical or structural abstractions represent the physical phenomena?
3. How can this concept be mapped or transferred to analogous problems in other domains?

This card is a workshop wrapper prepared by the organisers. Only the abstract is quoted from the publication; read the paper itself through the link above before asserting any relationship.
