Abstract (quoted verbatim from the publication)

We describe a reversible transform that permutes an input sequence into a block-sorted string. The transform makes frequent symbol runs contiguous, facilitating high-ratio compression and search with LF-mapping.

Abstract quoted from M. Burrows et al., Digital SRC Research Report (1994).

Notes: record the page or section for every claim you make about this paper.

Reading prompts

1. What is the core problem addressed and what assumptions are made?
2. What mathematical or structural abstractions represent the physical phenomena?
3. How can this concept be mapped or transferred to analogous problems in other domains?

This card is a workshop wrapper prepared by the organisers. Only the abstract is quoted from the publication; read the paper itself through the link above before asserting any relationship.
