Abstract (quoted verbatim from the publication)

Bowtie aligns short sequencing reads to the human genome at rates exceeding 25 million reads per hour. It creates an FM-index from the Burrows-Wheeler Transform, indexing 3 billion base pairs in under 1.3 GB of RAM.

Abstract quoted from B. Langmead et al., Genome Biology (2009).

Notes: record the page or section for every claim you make about this paper.

Reading prompts

1. What is the core problem addressed and what assumptions are made?
2. What mathematical or structural abstractions represent the physical phenomena?
3. How can this concept be mapped or transferred to analogous problems in other domains?

This card is a workshop wrapper prepared by the organisers. Only the abstract is quoted from the publication; read the paper itself through the link above before asserting any relationship.
