Abstract

This paper considers the model problem of reconstructing an object from incomplete frequency samples. Consider a discrete-time signal f∈C^N and a randomly chosen set of frequencies Ω. Is it possible to reconstruct f from the partial knowledge of its Fourier coefficients on the set Ω? A typical result of this paper is as follows. Suppose that f is a superposition of |T| spikes f(t)=Σ_τ∈Tf(τ)δ(t-τ) obeying |T|≤C_M·(log N)^-1 · |Ω| for some constant C_M>0. We do not know the locations of the spikes nor their amplitudes. Then with probability at least 1-O(N^-M), f can be reconstructed exactly as the solution to the ℓ_1 minimization problem. In short, exact recovery may be obtained by solving a convex optimization problem. We give numerical values for C_M which depend on the desired probability of success. Our result may be interpreted as a novel kind of nonlinear sampling theorem. In effect, it says that any signal made out of |T| spikes may be recovered by convex programming from almost every set of frequencies of size O(|T|·logN). Moreover, this is nearly optimal in the sense that any method succeeding with probability 1-O(N^-M) would in general require a number of frequency samples at least proportional to |T|·logN. The methodology extends to a variety of other situations and higher dimensions. For example, we show how one can reconstruct a piecewise constant (one- or two-dimensional) object from incomplete frequency samples - provided that the number of jumps (discontinuities) obeys the condition above - by minimizing other convex functionals such as the total variation of f.

Notes: record the page or section for every claim you make about this paper.

Reading prompts

1. What problem does the paper try to solve? Write it in one sentence, in your own words.
2. What is unknown or hidden, and what can actually be observed or measured?
3. What method do the authors use? Is it new, borrowed from another paper, or a modification of one?
4. What evidence do they give (proofs, simulations, experiments, real data)?
5. What assumptions or limitations can you find?
6. Which other papers in the corpus does it cite, use, extend or resemble? Note the page or section.
